

G. Lambert.

WAVE ENERGY:
MAKING BEST USE OF A
VARIABLE RESOURCE

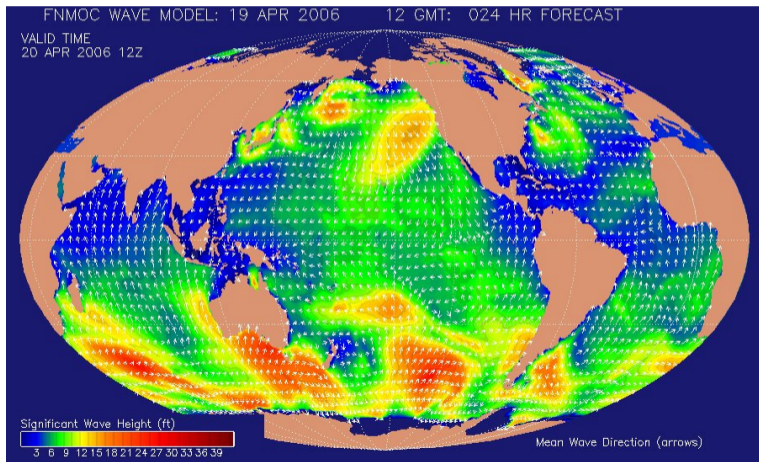

Denis Mollison

<http://www.ma.hw.ac.uk/~denis>

Contents

1. The wave energy resource
2. Deep water surface waves
3. Directional spectra
4. Devices
5. Estimating the resource
6. Deploying and integrating renewables

UK resource ~ 1 TWh/day

\sim UK elec. usage

1 TWh \sim Indian ocean tsunami

2 Deep water surface waves

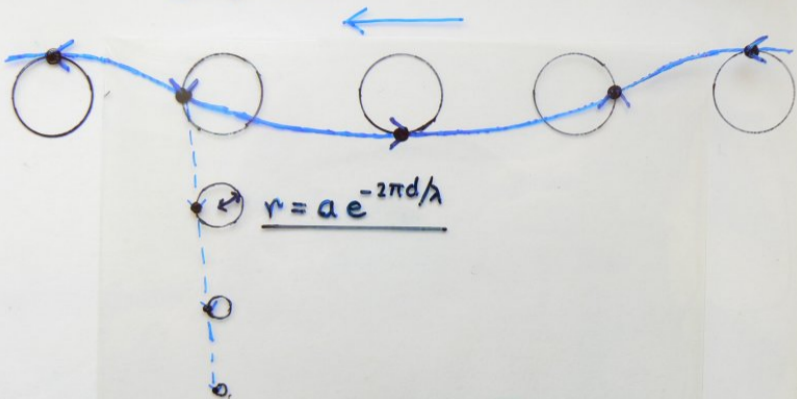

Single frequency wave

wavelength $\lambda = uT$; also $u = \frac{\omega}{2\pi} T$.
amplitude a

wavelength $\lambda = uT$; also $u = \frac{g}{2\pi} T$.
amplitude a

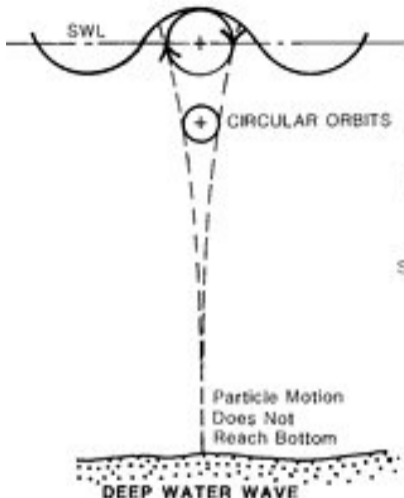

$$\text{Energy} \propto \frac{1}{2} a^2 = H_{\text{rms}}^2$$

$$\text{Power} = E \times u = k H^2 T$$

$$(k \doteq 7.9)$$

Wave Propogation

NOT
TO
SCALE

Wave Propogation

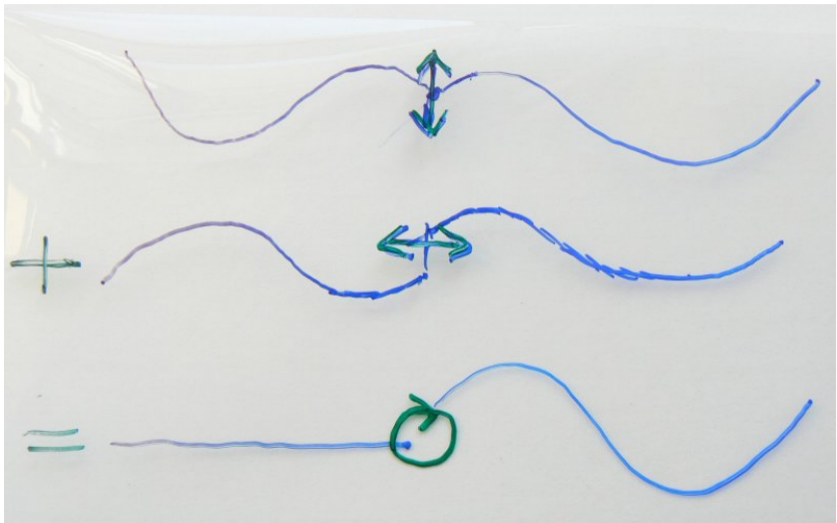

Group velocity is $U/2$ in deep water

– dispersive waves

but $\approx U$ in shallow water

– soliton (tsunami)

Waves are additive

Sum of many frequencies

WAVE RECORD

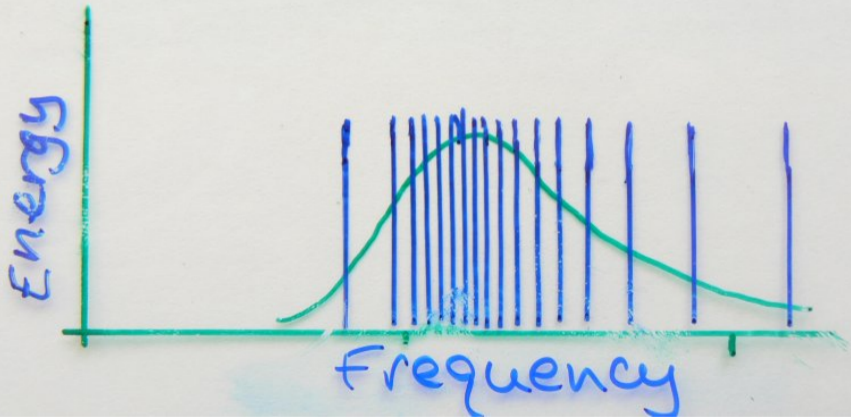

20 June 77

FFT

Generation of mixed seas "comb" spectra

SCALING:

$$\text{wind power} = (mU^2/2) \times U \quad \sim U^3$$

$$\begin{aligned} \text{wave power} &= (cH^2) \times U \\ &= (c'U^4) \times U \quad \sim U^5 \end{aligned}$$

$$\propto \text{wind power} \times \text{fetch}$$

(fetch like H scales as wavelength, $\propto U^2$)

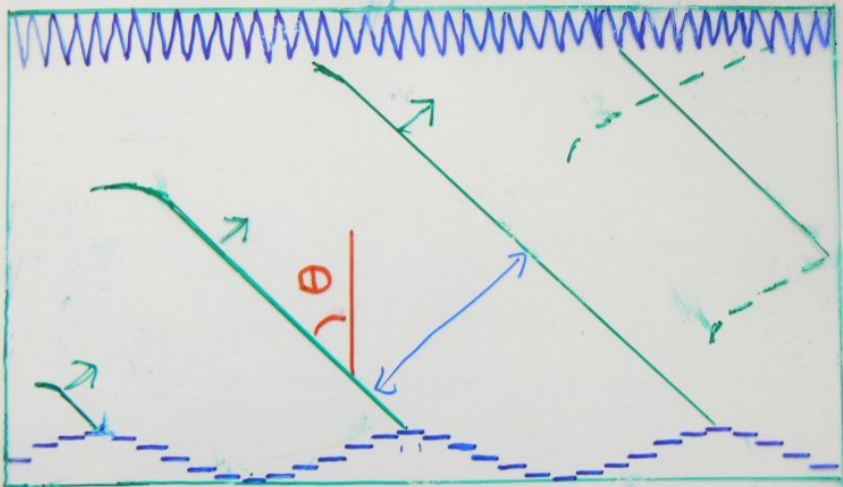

VARIABILITY OVER TIME:

On a scale of seconds or metres, wave power at a point is much more variable than wind

On a scale of hours or kilometres, the *sea state* is significantly less variable than the wind, with mean power $P = kH_{rms}^2 T_e$

Phase control → designer waves

4 Devices

Oscillating water column

3. The Wells Turbine rotates in the same direction regardless of the direction of the air flow. Thus generating irrespective of upward or downward movement of the water column.

2. Air is compressed and decompressed by the Oscillating Water Column (OWC). This causes air to be forced through the Wells Turbine and then drawn back through the Wells Turbine.

1. Ocean waves raise and lower water level in the reinforced concrete Capture Chamber set into an excavated rock face.

LIMPET

Land Installed Marine Powered Energy Transformer

In essence, the Oyster wave power device is simply a large pump which provides the power source for a conventional onshore hydro-electric power plant.

Once commercialised, multiple Oyster wave power devices will be deployed in farms typically of 100MW or more.

Oyster² wave power device - How it works

by aquamarinepowerltd

High and Low Pressure Flow Lines

Pelamis

(see <http://www.oceanpd.com/>)

Wave direction

Waves move across the sea and cause the Pelamis to rise and fall in a snake-like motion.

Anchors

Ocean

Power cable

Sections move against each other on hinges resisted by hydraulic rams, driving generators to produce electricity.

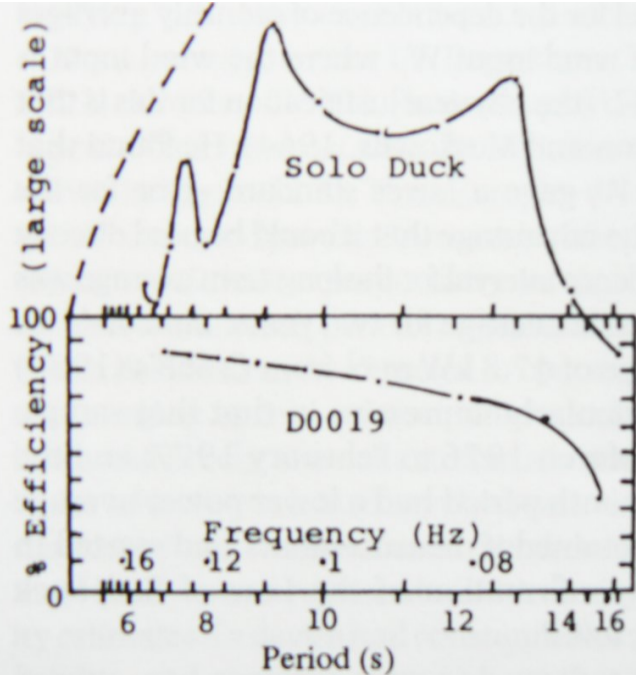

A 'wavefarm' would have 40 machines over a square km, generating power for 20,000 homes.

Small devices benefit from the point-absorber effect:

$$\text{“capture width”} = \lambda/\pi$$

(Evans, ca. 1980)
