Aims

To give an introduction to some advanced topics in number theory.

Syllabus

**Basics**: Revision of basic number theory: Euler's $\phi$ function; Modular arithmetic; Fundamental Theorem of Arithmetic and Chinese Remainder Theorem (3 lectures)

**Congruences and units mod $n$**: Polynomial congruences; Hensel's Lemma; algebraic structure of the group of units in $\mathbb{Z}_n$; primitive units. (5 lectures)

**Quadratic residues**: The Legendre symbol and the law of quadratic reciprocity (5 lectures)

**Distribution of primes**: Primes in specific congruence classes; Fermat primes and Mersenne primes; The Prime Number Theorem. (5 lectures)

**Sums of squares**: Gaussian integers; sums of squares. (5 lectures)

**Möbius inversion**: Arithmetic functions; the Möbius function and the Möbius inversion formula. (4 lectures)

**The Riemann zeta function**: Dirichlet series; introduction to the Riemann $\zeta$-function. (3 lectures)

Teaching and Assessment

**Contact Hours**: 3 lectures and 1 tutorial per week

**Assessment**: 0% by class tests or other continuous assessment

100% by end of course 2-hour exam

**Resit Type**: none
By the end of the course, students should be able to:

- have a good grasp of the fundamentals of number theory
- be able to manipulate Legendre symbols using quadratic reciprocity, and apply this to quadratic congruence problems
- have an understanding of the theory of the distribution of primes
- understand and manipulate Gaussian integers, and apply them to problems about sums of squares
- have an understanding of the basic theory of arithmetic functions and Dirichlet series
