

**INTEREST-RATE MODELS:
AN INTRODUCTION**

BY ANDREW J.G. CAIRNS
Heriot-Watt University
Edinburgh

Contents

1	Introduction to Bond Markets	11
1.1	Bonds	11
1.2	Fixed interest bonds	12
1.2.1	Introduction	12
1.2.2	Clean and dirty prices	13
1.2.3	Zero-coupon bonds	15
1.2.4	Spot rates	15
1.2.5	Forward rates	15
1.2.6	Risk-free rates of interest and the short rate	16
1.2.7	Par yields	17
1.2.8	Yield to maturity or gross redemption yield for a coupon bond	17
1.2.9	Relationships	19
1.2.10	Example	19
1.3	STRIPS	21
1.4	Bonds with built-in options	21
1.5	Index-linked bonds	22
1.6	General theories of interest rates	22
1.6.1	Expectations theory	22
1.6.2	Liquidity preference theory	23
1.6.3	Market segmentation theory	24
1.6.4	Arbitrage-free pricing theory	24
1.7	Exercises	26

2	Arbitrage-Free Pricing	29
2.1	Example of arbitrage: parallel yield curve shifts	30
2.2	Fundamental Theorem of Asset Pricing	32
2.3	The long-term spot rate	34
2.4	Factors	37
2.5	A bond is a derivative	38
2.6	Put-call parity	38
2.7	Types of model	39
2.8	Exercises	40
3	Discrete-time Binomial Models	43
3.1	A simple no-arbitrage model	43
3.2	The Ho & Lee no-arbitrage model	44
3.3	Recombining binomial model	47
3.4	Models for the risk-free rate of interest	52
3.4.1	Time homogeneity	52
3.4.2	Calculation of bond prices	55
3.4.3	Derivative prices	57
3.5	Futures contracts	61
3.6	Exercises	65
4	Continuous-Time Interest-Rate Models	69
4.1	One-factor models for the risk-free rate	69
4.1.1	Other characteristics	71
4.2	The martingale approach	72
4.3	The PDE approach to pricing	77
4.4	Further comment on the general results	80
4.5	The Vasicek model	81
4.5.1	Bond and option prices	82
4.6	The Cox-Ingersoll-Ross model	82
4.6.1	Introduction	82

4.6.2	Multi-dimensional Ornstein-Uhlenbeck processes	85
4.6.3	The non-central chi-squared distribution	86
4.7	Comparison of the Vasicek and CIR models	88
4.7.1	Introduction	88
4.7.2	Forward-rate curves	88
4.7.3	Probabilistic differences and option prices	90
4.8	Affine short-rate models	93
4.9	Other short-rate models	95
4.10	Options on coupon-paying securities	96
4.11	Exercises	98
5	No-arbitrage Models	103
5.1	Introduction	103
5.2	Markov models	104
5.2.1	The Ho and Lee model	105
5.2.2	The Hull and White model	106
5.2.3	The Black-Karasinski model	107
5.3	The Heath-Jarrow-Morton (HJM) framework	109
5.3.1	The risk-free asset	111
5.3.2	Tradeable assets	111
5.3.3	Change of measure	112
5.3.4	Replicating strategies	113
5.3.5	The arbitrage-free market	114
5.4	Relationship between HJM and Markov models	115
5.4.1	Ho and Lee	115
5.4.2	Hull and White	115
5.5	Exercises	116
6	Multifactor models	121
6.1	Introduction	121
6.2	Affine models	125

6.2.1	Gaussian multifactor models	127
6.2.2	Generalised CIR models	128
6.2.3	The Longstaff and Schwartz model	132
6.3	Consols models	134
6.3.1	The Brennan & Schwartz consols model	135
6.3.2	The Rebonato log-normal model	136
6.4	Multifactor Heath-Jarrow-Morton models	137
6.5	Options on coupon-paying securities	139
6.6	Quadratic term-structure models	140
6.7	Other multifactor models	141
6.8	Exercises	142
7	The Forward Measure Approach	143
7.1	A new numeraire	143
7.2	Change of measure	144
7.3	Derivative payments	144
7.4	A replicating strategy	145
7.5	Evaluation of a derivative price	146
7.6	Equity options with stochastic interest	149
7.7	Exercises	152
8	Positive interest	155
8.1	Introduction	155
8.2	Mathematical development	155
8.3	The Flesaker & Hughston approach	159
8.3.1	Calibration of the Flesaker & Hughston model	159
8.3.2	Forward rates	160
8.4	Derivative pricing	160
8.5	Examples	161
8.6	Exercises	167
9	Market models	169

9.1	Market rates of interest	169
9.2	LIBOR market models: the BGM approach	171
9.3	Simulation of LIBOR market models	178
9.4	Swap market models	179
9.5	Exercises	182
10	Numerical Methods	185
10.1	Choice of measure	185
10.2	Lattice methods	186
10.2.1	The general lattice model	187
10.2.2	Derivative pricing	188
10.2.3	The Hull & White trinomial lattice model	188
10.3	Finite-difference methods	195
10.3.1	Explicit finite differences	199
10.3.2	Implicit finite differences	200
10.3.3	Solution of a nearly tridiagonal system of equations	202
10.3.4	Orders of convergence	203
10.3.5	The Crank-Nicolson method	204
10.4	Numerical examples	205
10.5	Simulation methods	210
10.5.1	Basic Monte Carlo	213
10.5.2	Stratified and Latin-Hypercube sampling	216
10.5.3	Quasi-Monte Carlo or low-discrepancy sequences	217
10.5.3.1	Halton sequences	219
10.5.3.2	Faure sequences	220
10.5.4	Importance sampling or change of measure	222
10.5.5	Antithetic variates	223
10.5.6	Control variates	225
10.6	Exercise	227
11	Credit risk	229

11.1	Introduction	229
11.1.1	Yield to maturity	230
11.2	Structural models	231
11.2.1	The Merton model	231
11.2.2	Other models	233
11.3	A discrete-time model	233
11.4	Reduced-form models	238
11.4.1	Single credit class	238
11.4.2	Multiple credit classes: the JLT model	241
11.4.2.1	The market risk premium	245
11.4.3	Examples	246
11.4.4	Other intensity-based models	250
11.5	Derivative contracts with credit risk	251
11.6	Exercises	256
12	Model Calibration	259
12.1	Descriptive models for the yield curve	259
12.2	A general parametric model	260
12.3	Estimation	261
12.4	Splines	266
12.4.1	Cubic splines	266
12.4.2	B-Splines	267
12.4.3	Estimation	267
12.5	Volatility calibration	271
12.6	Exercises	273
A	Summary of key probability and SDE theory	275
A.1	The multivariate normal distribution	275
A.2	Brownian motion	276
A.3	Ito Integrals	277
A.4	One-dimensional Ito and diffusion processes	278

A.5	Multi-dimensional diffusion processes	279
A.6	The Feynman-Kac Formula	280
A.7	The martingale representation theorem	281
A.8	Change of probability measure	281
B	The Vasicek and CIR Models: Proofs	285
B.1	The Vasicek model	285
B.2	The Cox-Ingersoll-Ross model	290
B.2.1	Proof of Theorem 4.6.1.1	290
