Introduction to Cancer Invasion

Cells in a solid tumour invade surrounding tissue due to changes in:

- migration
- protease/anti-protease production
- adhesion

Carcinoma of the uterine cervix

Introduction to Cancer Invasion

Cells in a solid tumour invade surrounding tissue due to changes in:

- migration
- protease/anti-protease production
- **adhesion**: decreased cell-cell adhesion and increased cell-matrix adhesion

Carcinoma of the uterine cervix

Modelling Adhesion in Cancer

Variables: $n(x, t)$ tumour cell density, $m(x, t)$ matrix density

$$\frac{\partial n}{\partial t} = - \overbrace{\frac{\partial}{\partial x} [n \cdot K_{nn}]}^{\text{cell-cell adhesion}} - \overbrace{\frac{\partial}{\partial x} [n \cdot K_{nm}]}^{\text{cell-matrix adhesion}} + \overbrace{n(1-n)}^{\text{cell proliferation}}$$

$$\frac{\partial m}{\partial t} = - \underbrace{\lambda \cdot n \cdot m^2}_{\text{matrix degradation}}$$

Modelling Adhesion in Cancer

Variables: $n(x, t)$ tumour cell density, $m(x, t)$ matrix density

$$\frac{\partial n}{\partial t} = - \overbrace{\frac{\partial}{\partial x} [n \cdot K_{nn}]}^{\text{cell-cell adhesion}} - \overbrace{\frac{\partial}{\partial x} [n \cdot K_{nm}]}^{\text{cell-matrix adhesion}} + \overbrace{n(1-n)}^{\text{cell proliferation}}$$

$$\frac{\partial m}{\partial t} = - \underbrace{\lambda \cdot n \cdot m^2}_{\text{matrix degradation}}$$

Modelling Adhesion in Cancer

Variables: $n(x, t)$ tumour cell density, $m(x, t)$ matrix density

$$\frac{\partial n}{\partial t} = - \overbrace{\frac{\partial}{\partial x} [n \cdot K_{nn}]}^{\text{cell-cell adhesion}} - \overbrace{\frac{\partial}{\partial x} [n \cdot K_{nm}]}^{\text{cell-matrix adhesion}} + \overbrace{n(1-n)}^{\text{cell proliferation}}$$

$$\frac{\partial m}{\partial t} = - \underbrace{\lambda \cdot n \cdot m^2}_{\text{matrix degradation}}$$

Modelling Adhesion in Cancer

Variables: $n(x, t)$ tumour cell density, $m(x, t)$ matrix density

$$\frac{\partial n}{\partial t} = - \overbrace{\frac{\partial}{\partial x} [n \cdot K_{nn}]}^{\text{cell-cell adhesion}} - \overbrace{\frac{\partial}{\partial x} [n \cdot K_{nm}]}^{\text{cell-matrix adhesion}} + \overbrace{n(1-n)}^{\text{cell proliferation}}$$

K_{nn} = cell flux due to cell-cell adhesion

$$\frac{\partial m}{\partial t} = - \underbrace{\lambda \cdot n \cdot m^2}_{\text{matrix degradation}}$$

Modelling Cell-Cell Adhesion

- Adhesive flux K_{nn} is proportional to the force due to breaking and forming adhesive bonds (Stokes' Law: low Reynolds number)
- The force on a cell at x exerted by cells and matrix a distance x_0 away depends on:
 - 1 cell and matrix densities at $x + x_0$
 - 2 distance $|x_0|$
 - 3 sign of x_0 (\Rightarrow direction of force)

$$f(x, x_0) = g(n(x + x_0, t), m(x + x_0, t)) \cdot \omega(x_0)$$

Modelling Cell-Cell Adhesion

- Adhesive flux K_{nn} is proportional to the force due to breaking and forming adhesive bonds (Stokes' Law: low Reynolds number)
- The force on a cell at x exerted by cells and matrix a distance x_0 away depends on:
 - 1 cell and matrix densities at $x + x_0$
 - 2 distance $|x_0|$
 - 3 sign of x_0 (\Rightarrow direction of force)

$$f(x, x_0) = g(n(x + x_0, t), m(x + x_0, t)) \cdot \omega(x_0)$$

- Total force = sum of all forces acting on cells at x

$$F(x) = \int_{-R}^{+R} f(x, x_0) dx_0$$

Model Details: The Sensing Radius, R

Model Details: The Function $\omega(x_0)$

$\omega(x_0)$ is an odd function. For simplicity we take

$$\omega(x_0) = \begin{cases} -1 & \text{if } -R < x_0 < 0 \\ +1 & \text{if } 0 < x_0 < +R \end{cases}$$

Model Details: The Function $g(n)$

- At low cell densities, the force $f(x, x_0)$ will increase with cell density at $x + x_0$ when this is small.
- However, there will be a density limit beyond which cells will no longer aggregate.
- We account for this via a nonlinear $g(\cdot)$; we take $g(n, m) = n(n_{max} - n - m)$. Here n_{max} corresponds to no empty space.
- We rescale to give $n_{max} = 2$.

Modelling Adhesion in Cancer

Variables: $n(x, t)$ tumour cell density, $m(x, t)$ matrix density

$$\frac{\partial n}{\partial t} = - \overbrace{\frac{\partial}{\partial x} [n \cdot K_{nn}]}^{\text{cell-cell adhesion}} - \overbrace{\frac{\partial}{\partial x} [n \cdot K_{nm}]}^{\text{cell-matrix adhesion}} + \overbrace{n(1-n)}^{\text{cell proliferation}}$$

$$K_{nn} = \alpha \int_{-1}^1 n(x + x_0, t) \cdot (2 - n(x + x_0, t) - m(x + x_0, t)) \cdot \omega(x_0) dx_0$$

$$\frac{\partial m}{\partial t} = - \underbrace{\lambda \cdot n \cdot m^2}_{\text{matrix degradation}}$$

Modelling Adhesion in Cancer

Variables: $n(x, t)$ tumour cell density, $m(x, t)$ matrix density

$$\frac{\partial n}{\partial t} = - \overbrace{\frac{\partial}{\partial x} [n \cdot K_{nn}]}^{\text{cell-cell adhesion}} - \overbrace{\frac{\partial}{\partial x} [n \cdot K_{nm}]}^{\text{cell-matrix adhesion}} + \overbrace{n(1-n)}^{\text{cell proliferation}}$$

$$K_{nn} = \alpha \int_{-1}^1 n(x + x_0, t) \cdot (2 - n(x + x_0, t) - m(x + x_0, t)) \cdot \omega(x_0) dx_0$$

$$K_{nm} = \beta \int_{-1}^1 m(x + x_0, t) \cdot (2 - n(x + x_0, t) - m(x + x_0, t)) \cdot \omega(x_0) dx_0$$

$$\frac{\partial m}{\partial t} = - \underbrace{\lambda \cdot n \cdot m^2}_{\text{matrix degradation}}$$

Modelling Adhesion in Cancer

Variables: $n(x, t)$ tumour cell density, $m(x, t)$ matrix density

$$\frac{\partial n}{\partial t} = - \overbrace{\frac{\partial}{\partial x} [n \cdot K_{nn}]}^{\text{cell-cell adhesion}} - \overbrace{\frac{\partial}{\partial x} [n \cdot K_{nm}]}^{\text{cell-matrix adhesion}} + \overbrace{n(1-n)}^{\text{cell proliferation}}$$

$$K_{nn} = \alpha \int_{-1}^1 n(x + x_0, t) \cdot (2 - n(x + x_0, t) - m(x + x_0, t)) \cdot \omega(x_0) dx_0$$

$$K_{nm} = \beta \int_{-1}^1 m(x + x_0, t) \cdot (2 - n(x + x_0, t) - m(x + x_0, t)) \cdot \omega(x_0) dx_0$$

$$\frac{\partial m}{\partial t} = - \underbrace{\lambda \cdot n \cdot m^2}_{\text{matrix degradation}}$$

Extension to 2-D is straightforward

Simulation of a Non-Invasive Tumour

For cell-cell adhesion (α) relatively large and cell-matrix adhesion (β) relatively small, the model predicts a non-invasive tumour

Simulation of a Non-Invasive Tumour

For cell-cell adhesion (α) relatively large and cell-matrix adhesion (β) relatively small, the model predicts a non-invasive tumour

Simulation of a Non-Invasive Tumour

For cell-cell adhesion (α) relatively large and cell-matrix adhesion (β) relatively small, the model predicts a non-invasive tumour

Invasion can be initiated either by decreasing cell-cell adhesion (α) or by increasing cell-matrix adhesion (β)

The Sequential Development of an Invasive Tumour

Stage 1:
non-invasive
tumour growth

The Sequential Development of an Invasive Tumour

Stage 2:
mutation,
followed by
tumour invasion

The Sequential Development of an Invasive Tumour

Tumour morphology:

Detailed studies of tumour pathology reveal a correlation between the invasive potential of tumours and their shape. (Tumour shape is often quantified via fractal dimension.)

Explanation of Tumour Fingering

Model solns predict: invasion of uniform matrix \Rightarrow flat boundary
invasion of non-uniform matrix \Rightarrow fingering

invasion of non-uniform matrix \Rightarrow fingering

Cells

Matrix

Explanation of Tumour Fingering

Model solns predict: invasion of uniform matrix \Rightarrow flat boundary
invasion of non-uniform matrix \Rightarrow fingering

Basic explanation: invasion speed varies with matrix density.

Explanation of Tumour Fingering

Conclusions and Challenges

- Our model results are consistent with traditional thinking on cancer invasion.
- The model makes quantitative predictions on how invasion speed depends on adhesion strengths and matrix density, which are experimentally testable.
- The model makes detailed predictions on how tumour fingering depends on matrix heterogeneity; these are also experimentally testable.
- The model raises many computational challenges, in particular concerning extension to 3-D.
